

Alternative A: contour map of likely continuations

Use this if the paper wants the strongest visual link between prefixes, continuation probability, and task-local regions.

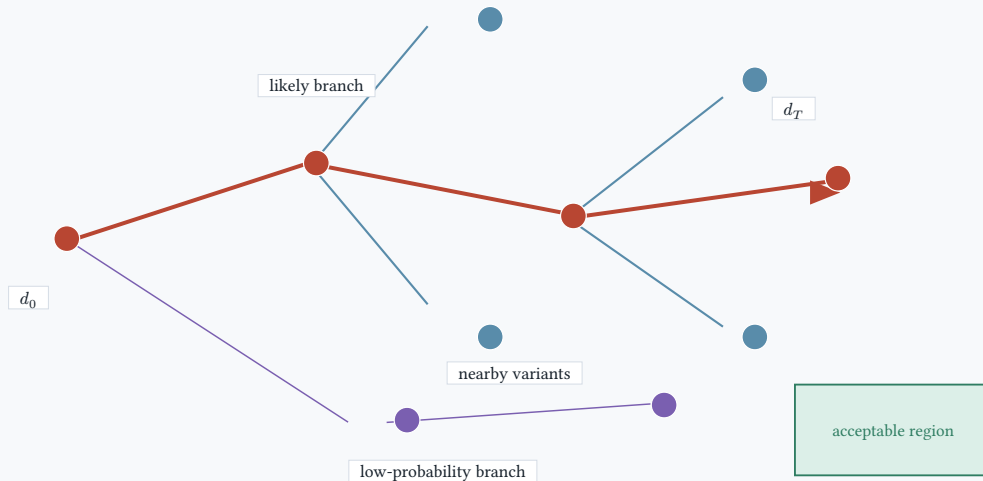

Alternative B: terrain profile along one local direction

Use this if the manuscript needs the “valley / plain / ridge” explanation more than a literal map.

Alternative C: prefix-state flow with branch likelihoods

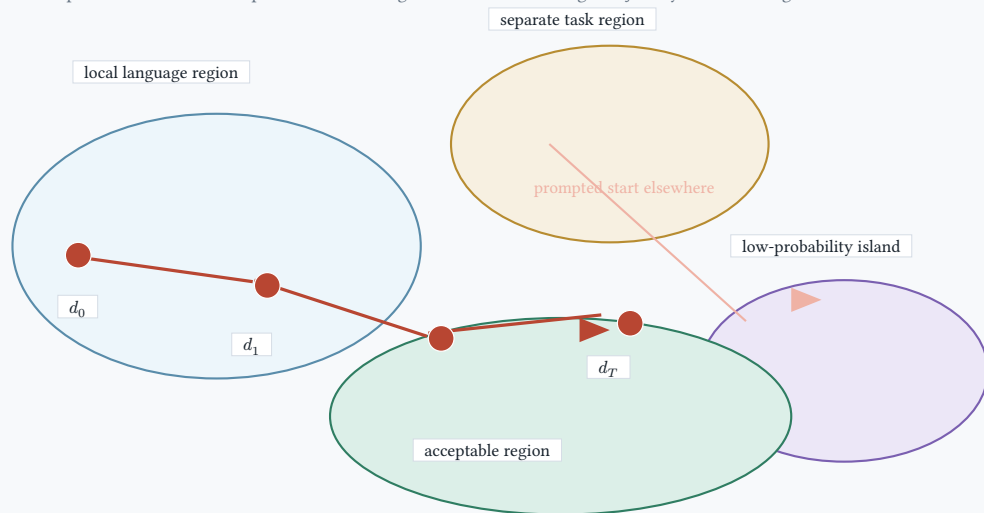

Each node is a prefix. Edge weight sketches relative next-token continuation probability.

Use this if the figure should emphasize discrete prefixes rather than a continuous surface.

Alternative D: task-local regions, not one global manifold

A document-space sketch can show separate task-local regions while still drawing a trajectory inside one region.

Use this if the section's caveat about disconnected, task-local regions should be visible in the same figure.
